Internship Worklog — Week 1 - Dhruv Jain
Reporting Period: 12 October – 16 October 2026

Monday, 12 October 2026 — Onboarding and Initial Familiarisation

- Began the internship onboarding process and familiarised myself with the organisation's work environment and BI product.
- Reviewed the BI portal and understood the initial objective of exploring its modules, workflows, and functionality.
- Identified the key modules to investigate, including CHC, Access Management, Placements, Feed, Infrastructure, Booths, Mess, Assets, and Hostels.
- Established an initial approach for recording observations, navigation steps, and areas requiring further clarification.

Outcome: Established a basic understanding of the internship objectives and the scope of the BI portal exploration.

Tuesday, 13 October 2026 — BI Portal Exploration

- Explored the BI portal's interface and navigated through the available modules to understand their purpose and organisation.
- Began examining the functionality of individual sections and the options available within them.
- Observed how different modules were presented and identified areas where additional investigation was required.
- Started documenting observations and noting instances where certain options did not display an expected result.

Outcome: Developed an initial understanding of the portal's structure and began identifying workflows for more detailed examination.

Wednesday, 14 October 2026 — Workflow Exploration and Product Understanding

- Continued exploring the BI portal with a focus on understanding the relationship between different modules and their underlying workflows.
- Investigated areas related to placements, access management, and administrative operations.
- Examined available interface options and recorded observations regarding navigation, expected behaviour, and functionality requiring clarification.
- Worked towards understanding the product from a user's perspective, focusing on how users interact with the available features.

Outcome: Improved familiarity with the product's user interface and identified specific workflows requiring further functional investigation.

Thursday, 15 October 2026 — Functional Investigation and Documentation

- Continued the systematic exploration of the portal's administrative and operational modules.
- Examined workflows involving academic structures, programme-related configurations, student data uploads, and staff management.
- Recorded observations about the steps involved in navigating these workflows and the responses displayed by the interface.
- Identified areas where the observed behaviour needed clarification before drawing conclusions about potential functional issues.
- Continued organising findings to make subsequent investigation and discussion with the team more structured.

Outcome: Built a more detailed understanding of selected administrative workflows and documented areas for further verification.

Friday, 16 October 2026 — Consolidation and Next Steps

- Continued reviewing the modules and workflows explored during the week.
- Consolidated observations regarding portal navigation, administrative functionality, and selected data-management processes.
- Identified unresolved questions and areas where expected system behaviour required confirmation from the relevant team.
- Organised the findings to support continued investigation and a more structured approach to testing the product in the following week.
- Outlined the next steps for deeper workflow analysis, validation of observed behaviour, and technical exploration where appropriate.

Outcome: Completed the initial product familiarisation phase and established a foundation for more focused functional testing and data-oriented investigation in the following week.

Week 1 Summary

During the first week, the primary focus was on understanding the Digii Campus BI portal, exploring its modules, examining selected administrative workflows, and documenting observations about interface behaviour. This initial exploration helped establish familiarity with the product and identify areas for further investigation.

Planned continuation: Conduct more structured workflow testing, validate observations with the team, and deepen technical understanding of the product and its underlying data where access and permissions allow.
