Evaluating Non-Academic Student Development

A proposed framework, product design and enhancement plan for Digii Campus

Prepared by: Dhruv Jain, Data Intern, Digii Campus | Prepared for: Mr Suraj Bhatt | Date: 26 October 2026

1. Introduction and Problem Statement

1.1 How academic performance is evaluated

Every university has its own grading system across its courses and years. A university offers multiple degree programmes; BML Munjal University, for example, offers B.Tech (CSE/ECE), Liberal Arts, BBA, BBA-LLB and B.Com. Within each programme there are semesters, terms, years of joining and batches, each with many enrolled students.

As a student enrolled in the B.Tech programme in Computer Science Engineering, I study several courses every semester, and the assessment pattern usually differs from course to course. Some courses have a quiz, a mid-semester examination, an end-semester examination and written assignments; others follow different patterns. Consider a single course, Agentic AI. Its assessment consists of a 20-mark quiz, a 10-mark synopsis presentation, a mid-semester presentation and a 40-mark end-semester project presentation. What a student scores depends on their capability, and all of it contributes to a grade and, eventually, a CGPA.

This whole structure evaluates **academic performance**.

1.2 The gap: non-academic performance

The open question is how non-academic performance is evaluated. Non-academic performance includes involvement in clubs, societies, sports, events and functions held regularly at the university, participation in competitions, and group activities within academic courses (setting their marks aside, but still considering how the student behaves).

BML considers non-academic involvement for marks only in the first and second year, through the Enrichment Credit Course (ECC). Under ECC, the society or club the student has opted for is considered, the student's performance in individual or group activities is taken into account, and marks and grades are then assigned through relative grading. These grades do not actually help a student's non-academic development.

In my opinion, irrespective of the digital platform an institution uses, it should have modules that genuinely showcase a student's abilities in non-academic areas.

1.3 Illustrative example: the ACM Student Chapter

Consider a club such as an ACM Student Chapter. It hosts coding workshops, hackathons, project presentations and research-paper contributions. Such activities take place in groups of at least three, and regardless of group size, each member's contribution matters. For hosting an activity, we need to know which students take part in the Organizing Committee (OC), who organises the whole event, who handles marketing, and who handles the necessary backend work, as well as how the participating students perform.

Defining parameters of this kind benefits students and professors alike, because it lets them evaluate non-academic performance and understand how a student needs to improve in non-academic areas as well.

2. Proposed Dimensions of Non-Academic Performance

We cannot directly measure something vague such as "good personality" or "overall character". Instead, we break it into observable dimensions. For a college, I propose the following six dimensions initially. This is a proposed framework, not a universally accepted formula.

1. **Collaboration and teamwork:** Can the student work with others, communicate constructively, share responsibilities and contribute to group goals?
2. **Leadership and initiative:** Does the student take initiative, coordinate people, solve problems, or lead a project or event?
3. **Contribution and community engagement:** Does the student contribute to clubs, volunteering, college initiatives or community projects?
4. **Responsibility and reliability:** Does the student fulfil agreed responsibilities, meet deadlines and complete assigned work?
5. **Creativity and problem-solving:** Can the student develop ideas, handle challenges and produce useful solutions outside routine academic assessments?
6. **Personal and professional development:** Is the student developing skills through workshops, practical projects, competitions, feedback and reflection?

An important distinction. Attending ten events does not automatically mean someone has better teamwork than a student who attended three. Participation is evidence of involvement; performance is how well someone contributes; development is how they improve over time. These must be kept separate.

3. Collecting Evidence

Suppose we are evaluating one student for a semester. We should not ask a professor to guess whether the student is a good leader. We should collect evidence.

Dimension	Possible evidence
Teamwork	Peer feedback, verified team contributions, collaboration rubric
Leadership	Event or project role, supervisor assessment, decisions and outcomes
Community contribution	Verified volunteering, completed service tasks, project outcomes
Reliability	Assigned tasks, deadlines, completion and approved exceptions
Problem-solving	Project portfolio, challenge submissions, evaluator rubric
Development	Baseline and later skill assessments, completed training, reflection

Each record should ideally contain the activity or task, the student's actual role, the evidence, who verified it, the assessment criteria and the assessment date.

A booth check-in alone proves attendance. It does not prove leadership, teamwork or the quality of the student's contribution.

4. Assessment and Scoring Method

4.1 Rubric-based assessment (worked example: teamwork)

This is where the actual calculation happens. Using teamwork as an example, we create a standard rubric with four performance levels. In the example, a supervisor evaluates a student's contribution to a verified team project.

Level	Description
1. Needs improvement	Rarely contributes or does not fulfil agreed responsibilities.

Level	Description
2. Developing	Contributes sometimes but needs frequent guidance.
3. Proficient	Contributes consistently, communicates well and fulfils their role.
4. Strong performance	Actively supports teammates, resolves collaboration issues and improves the team's work.

For a more reliable assessment, teamwork is split into four criteria: communication; sharing responsibilities; supporting teammates; and handling disagreements constructively. The evaluator scores each criterion from 1 to 4. Suppose the student scores 3, 4, 3 and 3.

```
Teamwork Score = (3 + 4 + 3 + 3) / (4 x 4) x 100 = 13 / 16 x 100 = 81.25 / 100
```

The student's teamwork score is 81.25/100 for that assessment. We did not ask an algorithm to discover that the student is a good teammate. We defined observable behaviours, gathered evidence and applied a consistent scoring rubric. The rubric itself still needs testing, and multiple evaluators may be needed for important decisions.

4.2 Indicators calculated directly from records

A. Participation rate = (eligible activities attended / eligible activities offered) x 100. Example: 8 attended out of 10 eligible opportunities = 80%.

B. Reliability rate = (tasks completed on time / eligible tasks due) x 100. Example: 10 completed on time out of 12 tasks = 83.33%.

C. Skill development = later assessment − baseline assessment. Example: a skill assessment rising from 60 to 75 = +15 points.

These are indicators, not complete measures of a student's character or ability. Participation rate tells us about involvement, not the quality of involvement. A student who was not given any tasks should not automatically receive a zero reliability score.

4.3 Composite score (illustrative)

Once every dimension has a valid score, a composite score can be calculated. The following illustrative starting model uses weights proposed for demonstration only; a college would need to validate them rather than assume they are objectively correct.

Dimension	Weight
Collaboration and teamwork	20%
Leadership and initiative	15%
Community contribution	15%
Responsibility and reliability	15%
Creativity and problem-solving	15%
Personal and professional development	20%
Total	**100%**

Worked example for one student:

Dimension	Score	Weight	Weighted points
Teamwork	80	20%	16.00
Leadership	75	15%	11.25
Community contribution	70	15%	10.50
Reliability	90	15%	13.50
Problem-solving	85	15%	12.75
Development	80	20%	16.00
Overall		**100%**	**80.00 / 100**

The formula is $S = \Sigma (w_i \times s_i)$, summed over $i = 1$ to n, where s_i is the score for a dimension out of 100 and w_i is its weight expressed as a decimal. In this example, the overall non-academic development score is 80/100.

The college should also display the individual dimension scores, because two students could both score 80 overall while having very different strengths.

One crucial rule. If a student has no valid evidence for a dimension, the dimension must be marked as *not assessed* rather than silently treated as zero. If dimensions are missing, the system should clearly flag incomplete coverage or apply an explicitly approved method for calculating a partial score.

5. Proposed Product Modules

The modules below are my proposed product design, not a claim that Digii Campus currently has all these capabilities.

#	Module	Scope	Evidence generated
1	**Clubs and Societies Management** (foundation)	Register clubs, manage memberships, assign club positions, record meetings, track responsibilities and verify a student's actual contribution.	Membership, participation, roles and completed responsibilities. A membership record alone should not generate a high performance score.
2	**Events and Participation** (foundation)	Create events, manage registrations, verify attendance, assign roles and record post-event contributions.	Participation rate, event responsibilities and verified involvement. QR check-ins could establish attendance, while a separate evaluation establishes contribution quality.
3	**Volunteering and Community Service**	Maintain service opportunities, approved hours, assigned responsibilities, supervisor verification and project outcomes.	Community engagement, completed service and contribution quality. Hours can be recorded, but hours alone should not determine the score.
4	**Leadership and Student Governance**	Manage student council roles, club office-bearers, committee assignments, event coordinators and elected representatives.	Leadership responsibilities, completed initiatives, team coordination and supervisor assessments. Holding a title should not automatically earn a high leadership score; performance in the role must be assessed.

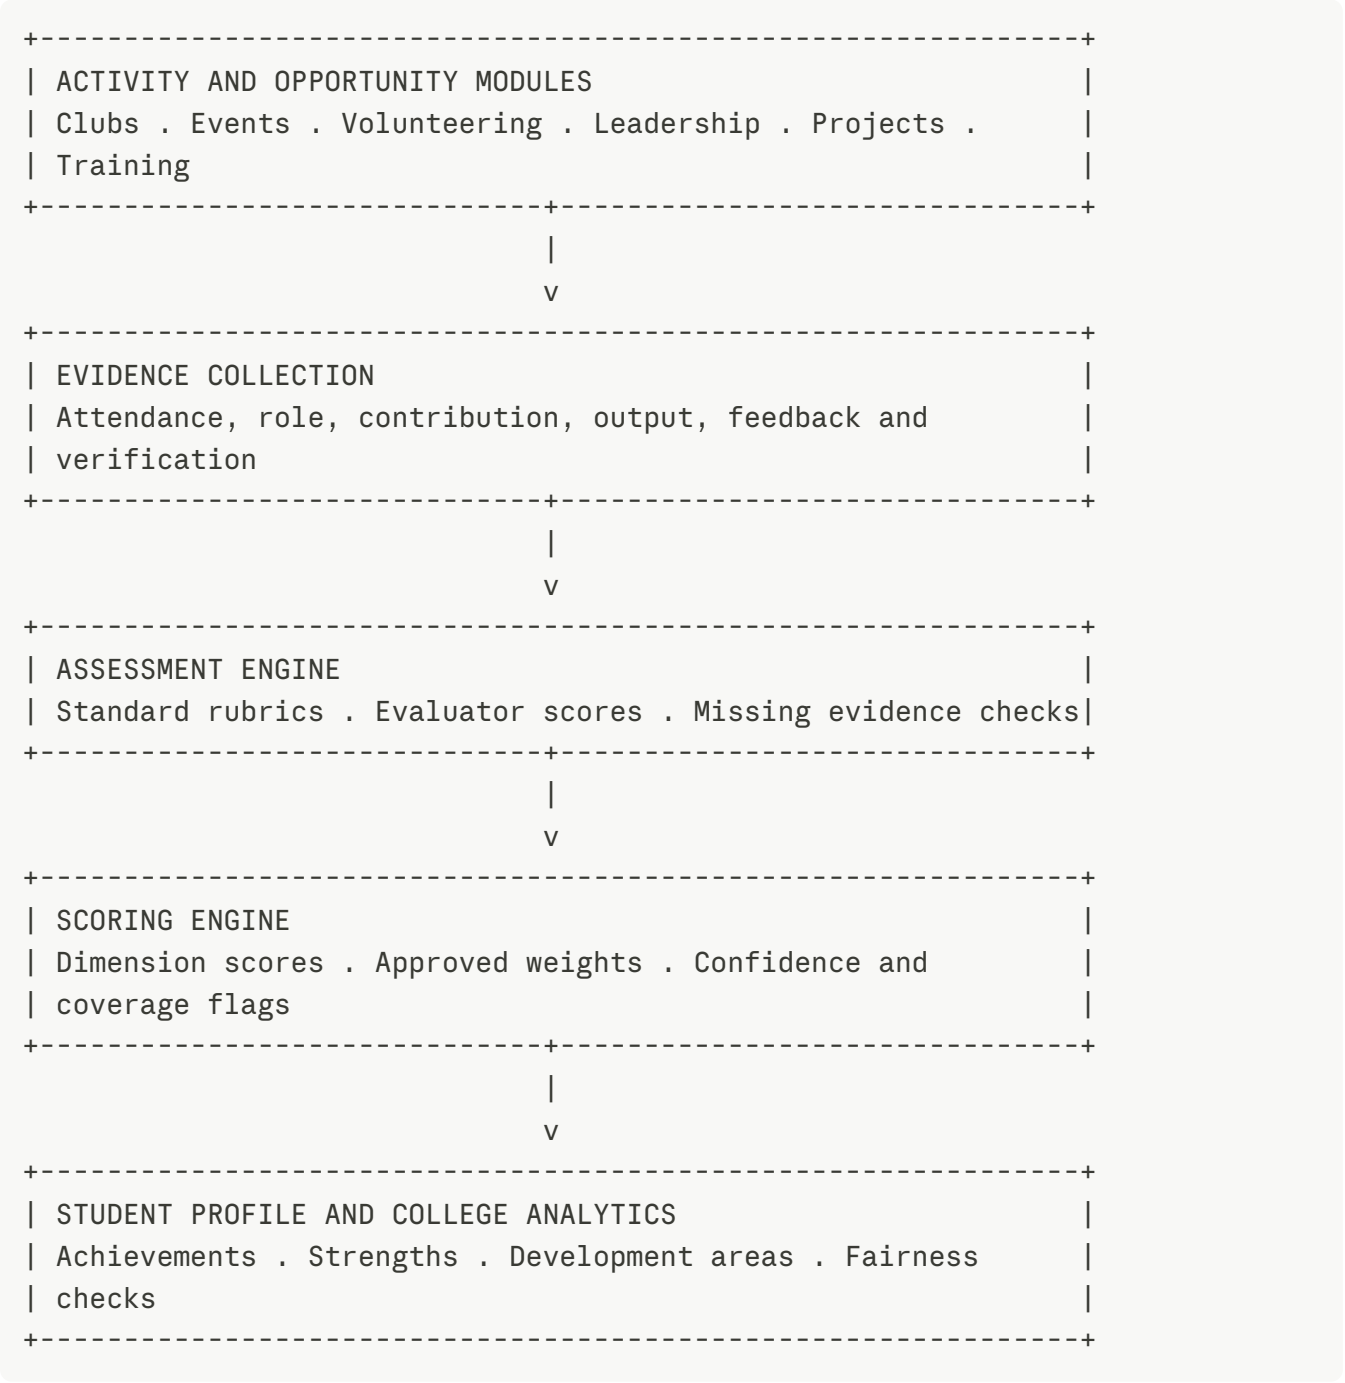

#	Module	Scope	Evidence generated
5	**Projects, Competitions and Innovation**	Record hackathons, case competitions, entrepreneurship activities, research outside coursework, design challenges and student-led projects. Students should be able to upload portfolios or demonstrations.	Problem-solving, creativity, initiative, teamwork and tangible project outcomes.
6	**Skills and Development**	Manage workshops, communication training, certifications, mentorship sessions and optional skill assessments.	Training completion, demonstrated skills, baseline-to-follow-up progress and reflection.
7	**Assessment and Verification Engine** (core differentiator)	Connects everything else. Lets colleges define rubrics, assign evaluators, collect evidence, request verification, handle conflicting assessments and calculate dimension-level scores.	Verified, rubric-based assessments ready for aggregation.
8	**Student Development Profile and Analytics** (student and college view)	Gives each student a development profile, achievements, evidence-backed scores, progress over time and recommended next steps. Administrators see aggregate patterns, participation gaps, assessment coverage and which activities reach students.	Profiles and aggregate reports.

Other valuable modules could include a peer and mentor feedback system, a verified student achievements portfolio, and a responsibility/task tracker for club officers and student committees.

A caution. I would be careful with a generic "behaviour score", or a module that scores students on hostel usage, mess spending or how often they visit campus facilities. Those records do not, by themselves, establish non-academic performance.

6. How the Modules Work Together

The flowchart below shows how all the modules work together as one structured pipeline.

At the end of this pipeline we have scores and reliable evidence that show whether they are valid. A proper roadmap can then guide execution of the process in detail. What I propose on top of this is a **Student Development Segmentation and Intervention System**, which answers the question: "We have the scores; what do we do next?"

7. Student Development Segmentation and Intervention System

7.1 The idea

1. Collect verified evidence of students' non-academic activities and contributions.
2. Assess their performance across different dimensions.
3. Identify their strengths and the specific skills they need to develop.
4. Group students with similar development needs.
5. Design targeted programmes for each group, led by suitable professors, mentors, trainers or industry professionals.
6. Measure whether those programmes actually help students improve.

An important refinement. Students should not be grouped only by their overall score; they should be grouped primarily by their development needs and strengths. Two students can both score 65/100 and need completely different support. One might be an excellent problem-solver who struggles with communication; another might communicate confidently but struggle with teamwork and reliability. Putting them in the same programme because their totals match would waste the opportunity.

7.2 How the grouping system works

```
STAGE 1  Verified student evidence
         Activities, project contributions, feedback, rubrics, assessments
            |
            v
STAGE 2  Multidimensional student profile
         Teamwork, communication, leadership, reliability,
         problem-solving, development
            |
            v
STAGE 3  Development-needs identification
         Strengths, specific skill gaps, student goals, evidence confidence
            |
            v
STAGE 4  Targeted student groups
         Communication . Teamwork . Leadership . Problem-solving
            |
            v
STAGE 5  Personalised development programmes
         Professors, mentors, workshops, practice sessions, projects
```

```
            |
            v
STAGE 6  Reassessment and improvement
         Measure skill growth, collect new evidence, update the plan
```

This creates a continuous improvement loop rather than a one-time ranking exercise.

7.3 Layer A: skill-based development groups

These are examples of groups the platform could identify.

Group	Example profile	Possible programme	Potential mentors
1. Strong skills, communication gap	Technically capable, but struggles to present ideas or communicate confidently.	*Communication and professional expression:* public speaking and presentation workshops; small-group discussions and structured debates; mock interviews and project demonstrations; faculty feedback on clarity, structure and audience engagement.	Communication faculty, presentation trainers, professionals who regularly communicate technical ideas.
2. Individual contributor, teamwork gap	Completes their own work well but struggles to coordinate with others.	*Collaborative problem-solving:* small team projects with rotating responsibilities; peer-feedback exercises; conflict-resolution scenarios; reflection on individual versus team outcomes.	Faculty project supervisors, trained facilitators.

Group	Example profile	Possible programme	Potential mentors
3. Strong contributor, leadership development	Performs well individually and contributes reliably, but has limited experience leading others.	*Leadership in practice:* lead a small student project; plan and execute an event; practise delegation and decision-making; receive structured feedback from a supervisor and team.	Experienced faculty coordinators, student-affairs staff, alumni with leadership experience.
4. Potential evident, reliability needs support	Demonstrates useful ideas but has difficulty following through on agreed tasks.	*Planning and execution:* break larger responsibilities into milestones; practise prioritisation and deadline planning; short mentor check-ins; track task completion and identify practical obstacles.	Faculty advisers, project coordinators, trained mentors.
5. Strong ideas, needs practical execution	Generates creative ideas but needs practice turning them into workable outcomes.	*Innovation and execution lab:* build a prototype or practical solution; test ideas with real users; work within time and resource constraints; present evidence of what worked and what did not.	Faculty project guides, innovation-centre staff, relevant industry professionals.

Group	Example profile	Possible programme	Potential mentors
6. Ready for advanced opportunities	Strong evidence across several dimensions and a desire for further challenges.	*Advanced leadership and impact:* lead cross-functional projects; mentor peers who opt into support; participate in external competitions or community initiatives; work on complex, longer-term projects.	Senior faculty, alumni, industry mentors, project sponsors.

Important (Group 4). Investigate barriers before assuming the student lacks discipline. Workload, unclear expectations and unequal access to resources can affect completion.

These groups are not permanent categories of students. They are temporary development pathways. A student might participate in communication and leadership programmes simultaneously, then move to a different pathway as their skills develop.

7.4 Layer B: broad readiness bands

If administrators also want an overall picture, the college could define broad bands. Development profiles decide what support a student receives; readiness bands provide a broad summary, if the college actually needs one.

Illustrative band	Meaning	What happens next
Foundation	Evidence suggests support is needed in several assessed areas	Individual development plan and targeted foundational programmes
Developing	Some strengths are evident, with identifiable areas to improve	Focused skill-building and supervised practice
Progressing	Demonstrates consistent performance in assessed areas	Advanced practice and new responsibilities
Advanced	Demonstrates strong performance across relevant, well-evidenced dimensions	Stretch projects, leadership opportunities and peer mentoring

I would not initially use fixed cut-offs such as 0–40, 41–60 and 61–80, because those numbers would be arbitrary until the framework is validated. Nor would I display these bands publicly or treat them as permanent labels. A student's overall band is also not enough to choose a programme; the skill profile should drive that decision.

7.5 How the platform decides which group a student belongs to

Illustrative student development profile (hypothetical scores, to demonstrate the workflow):

Dimension	Score
Problem-solving	90/100
Task reliability	85/100
Teamwork	80/100
Leadership	72/100
Communication	45/100

Suggested development pathway: Communication and professional expression. Communication is the lowest-scoring assessed dimension, while the student has evidence of strong problem-solving, reliability and teamwork. This is a recommendation for review, not an automatic judgement. The college should verify the evidence, consider the student's own goals and check whether the assessment reflects a genuine development need.

The decision process:

1. **Validate the evidence.** Has the student been assessed fairly, with sufficient opportunities to demonstrate the skill?
2. **Identify strengths and gaps.** Compare the student's evidence against the college's published rubric.
3. **Check the student's goals.** They may want to improve communication even if it is not their lowest score.
4. **Recommend a pathway.** Match the student to an appropriate programme, mentor and practical activities.
5. **Let an authorised adviser review it.** The system recommends; a person confirms the plan with the student.
6. **Reassess after the programme.** Use comparable assessments to determine whether the skill has improved.

The platform can begin with transparent, rule-based recommendations rather than machine learning. No AI model is needed to recommend a communication workshop to a student with a verified communication development need. Later, if the college collects enough reliable data, it could investigate whether more sophisticated recommendation methods genuinely improve outcomes.

8. Mentorship and Development Programme Management

I would create a dedicated **Mentorship and Development Programme Management** module. The college registers available mentors, their expertise, programme capacity, schedules and eligibility criteria, and the system matches students to appropriate programmes and mentors.

Student need	Programme	Suitable mentor
Communication	Presentation and speaking lab	Communication faculty
Teamwork	Collaborative project programme	Project supervisor
Leadership	Student leadership practicum	Faculty coordinator or experienced alumnus
Reliability	Planning and execution coaching	Faculty adviser
Problem-solving	Innovation and project lab	Relevant technical faculty
Professional development	Career-readiness workshops	Career services and industry mentors

The platform should also manage: programme creation and learning objectives; student enrolment and scheduling; mentor assignments and workload; attendance and completion records; baseline and follow-up assessments; student feedback and mentor observations; and programme outcome reports.

Professors should be assigned based on their expertise, capacity and suitability, not simply because the system identifies a group of students. Some programmes may be better delivered by trained communication coaches, counsellors, alumni or industry mentors.

9. Measuring Whether Programmes Work

This is the most important part of the idea. If 100 students are assigned to a communication programme and their average score rises from 45 to 70, that is encouraging, but we must still ask whether the assessment was consistent and whether the programme caused the improvement.

The platform should track: baseline skill scores; programme enrolment and attendance; completion and participation; follow-up scores using comparable rubrics; student feedback and demonstrated practical performance; and differences in outcomes across student groups, where appropriate.

```
Observed improvement = 70 - 45 = 25 points
```

That tells us the average score increased by 25 points. It does not, by itself, prove that the programme caused all 25 points of improvement. To evaluate effectiveness rigorously, the college can compare results with a suitable comparison group or use another appropriate evaluation design. Over time, this shows which programmes appear useful, for which students and under what circumstances.

10. Student Growth Intelligence (the ultimate product)

I would give this layer the working name **Student Growth Intelligence**. It has five components:

- **Student segmentation engine:** creates evidence-based development profiles and recommends suitable pathways.
- **Programme management:** lets colleges design workshops, learning objectives, schedules and practical assignments.
- **Mentor matching:** connects students to suitable faculty, trained mentors and professionals.
- **Outcome measurement:** tracks baseline performance, programme participation, subsequent assessments and improvement.
- **Fairness and oversight:** handles missing evidence, unequal opportunities, corrections, access controls and review of recommendations.

The competitive advantage is not simply that the college can see a student's score. It is that the college can move from **evidence → diagnosis of development needs → targeted intervention → measured improvement** in one connected workflow.

One final design decision: students should be partners in their development, not objects ranked by the institution. They should be able to see their own evidence, understand why a programme was recommended, choose relevant goals, challenge incorrect records and

track their progress privately. That makes the platform more useful than a ranking dashboard; it becomes a system designed to help students grow.

11. Adaptive Student Development and Progression Engine

11.1 A continuous improvement cycle

1. **Assess the student:** calculate evidence-based scores across communication, teamwork, leadership, reliability and other dimensions.
2. **Identify the weakest development area:** for example, communication 45/100 while problem-solving is 90/100.
3. **Assign a development group:** the student joins the Communication Development Programme.
4. **Provide targeted support:** faculty-led practice, workshops, feedback and real-world assignments.
5. **Reassess the student:** use comparable assessment criteria to calculate the updated score.
6. **Update the development pathway:** if the communication goal is achieved, reassess the remaining needs and recommend the next suitable programme.

The cycle repeats throughout the student's college journey.

11.2 Simulation (all scores hypothetical)

Dimension	Initial	Change	Follow-up
Communication	45	+27	72
Teamwork	75	+3	78
Leadership	60	+3	63
Problem-solving	90	+0	90
Reliability	80	+4	84

The first development target is communication. The college recommends a targeted programme after checking the evidence and discussing the goal with the student. After several weeks of practice and faculty feedback, the student is reassessed. The changes in each score are illustrative; the platform should not assume unrelated scores improved because of the communication programme.

Communication has improved from 45 to 72. Suppose the college's validated programme criteria require a score of at least 70, supported by sufficient evidence across the relevant communication skills. The student can then complete that development pathway.

The student should not automatically be promoted to a higher overall tier just because one score increased. The next action depends on the complete profile and the college's programme criteria. For example, leadership is still at 63, so the system might recommend a leadership development programme next, while the student continues to maintain their communication skills.

11.3 Groups as changing development pathways

Current situation	System action
Communication needs improvement	Recommend communication programme
Communication goal achieved; leadership still needs development	Complete or exit the communication pathway and recommend leadership support
Communication and leadership both need support	Offer both pathways if the student and timetable permit
All assessed goals met	Offer advanced opportunities or a student-selected development goal
New evidence reveals another gap	Reassess and recommend an appropriate pathway
Evidence is insufficient	Gather more evidence rather than automatically assigning a low score

A student can be in more than one development group at a time; we should not force every student into one exclusive category when development needs are multidimensional. Improvement should also not require a student to keep chasing ever-higher scores. Once a meaningful target is met, the system can shift towards maintaining the skill, applying it in new situations or pursuing another goal.

11.4 The module this creates

The **Adaptive Student Development and Progression Engine** has these responsibilities:

- **Profile updates:** maintain the latest verified score for every assessed dimension.
- **Development-gap detection:** identify areas where evidence indicates a need for support.

- **Programme recommendations:** match needs to suitable courses, workshops and mentors.
- **Progress tracking:** compare baseline and follow-up assessments.
- **Pathway transitions:** recommend entering, continuing, completing or changing a development programme.
- **Human approval:** allow authorised faculty or advisers to review important transitions.
- **Outcome analytics:** show which programmes are associated with meaningful improvement over time.

This is a simplified prototype of the decision logic. A production system would also consider evidence quality, programme eligibility, student preferences, multiple simultaneous needs, available mentors and approved transition rules. A single lowest score should not automatically determine a student's future.

11.5 The benefit for the college

Instead of only reporting that Student A scored 72 in communication, Student B scored 64 in leadership and Student C scored 80 overall, the college can answer more useful questions:

- Which skills are students struggling with most?
- Which programmes produce the strongest observed improvements?
- How many students have met their development goals?
- Which students would benefit from another intervention?
- Which programmes need redesign because students are not improving?
- Are students receiving fair access to development opportunities?

This makes the platform a closed-loop student development system: assess, support, reassess and adapt.

Final safeguard. The platform should describe a student's assessed skills and development needs, not label the student as inherently weak or superior. Scores are measurements with limitations, not permanent judgements about a person's potential.

12. Research Approach: Comparing Our Design with Digii Campus Modules

The next stage of this research is to explore the Digii Campus modules related to this work. For each module, we first write down what is present, who it is built for, how it works and how efficient it is. Once that is clear, we compare our self-made modules with Digii's to see where each falls short and what could be done to improve them.

Our proposed framework, **Situated Evidence Profiling (SEP)**, has a different purpose from most campus ERP modules. It focuses on evidence-backed competency claims, the quality and sufficiency of evidence, fair assessment, moderation, student correction and appeals, and development over time. Digii already has potentially useful building blocks for parts of this process. Our task is to identify where those building blocks align, where our design adds something important and where Digii's existing modules could themselves be improved.

12.1 Comparison: Digii modules versus the proposed SEP system

The table compares documented Digii capabilities with SEP's requirements. The SEP side describes design goals, not implemented software. Anything not established by the public product descriptions is marked *unverified*.

Digii module	Documented purpose	Fit with SEP (what is unverified)	Best role in our architecture
Student E-Portfolio	Manages student information, achievements, certificates and records	Strong conceptual overlap with a development profile. Competency-linked claims, rubrics, assessor assignment, moderation, appeals and competency-specific history are unverified.	Student-facing, evidence-backed portfolio
OBE	Defines, maps and assesses educational outcomes; preset assessment criteria, outcome mapping and reports	Closest conceptual overlap, since it already defines outcomes and competencies. Non-academic use, evidence verification and a separate evidence-sufficiency dimension are unverified.	Competency definitions and assessment model to investigate

Digii module	Documented purpose	Fit with SEP (what is unverified)	Best role in our architecture
Clubs & Societies	Manages clubs, members, office bearers and events; file and image uploads; past and upcoming events	Supplies the contexts in which competencies are demonstrated. Individual contribution verification and assessment roles are unverified; participation records alone cannot establish competence.	Source of activity opportunities and contribution records
CHC / Workflows	Configurable requests, approvals, work-centre assignment, routing and escalation; workflow histories	Could route evidence review. Evidence-upload capability, formal appeals and independent moderation are unverified; workflow consistency alone does not ensure fair assessment.	Process engine for submission, review, escalation and appeals
Intelligence	Institutional dashboards and analytics	Could report competency results and trends if reliable structured data exists. Cannot verify source evidence or guarantee valid assessment; aggregated metrics may conceal bias or missing evidence.	Reporting layer, after data quality and fairness safeguards

What the comparison tells us. The official pages substantiate the broad capabilities above. However, none establishes that Digii already provides the complete SEP process, particularly competency-linked evidence, a separate evidence-sufficiency judgement, independent moderation, student correction and appeals, and privacy-conscious longitudinal reporting.

Which is more aligned with the defined problem? SEP is more directly aligned with fair, evidence-based non-academic competency assessment, because that is what it was designed for. Digii has more mature, broader institutional areas that could supply

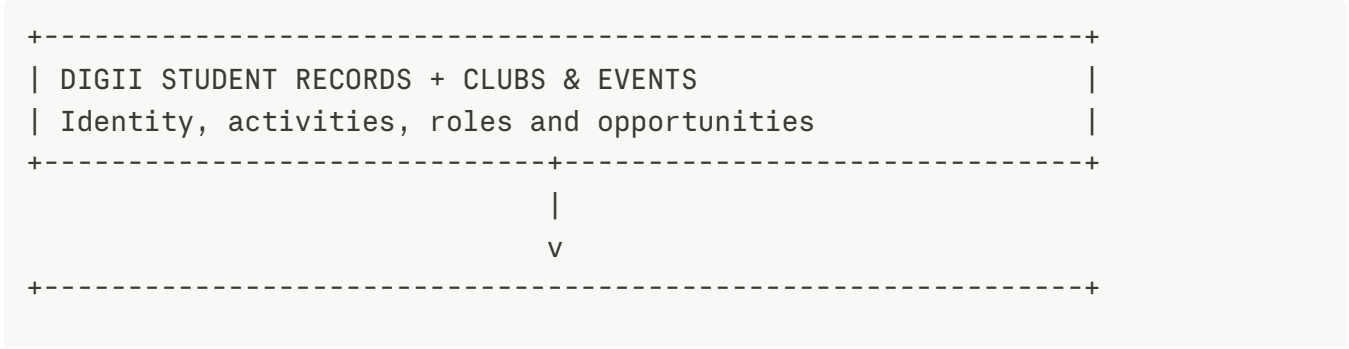

infrastructure. This compares intended scope, not effectiveness; implementation and validation are still needed. The closest matches are OBE (conceptual), E-Portfolio (student-facing), CHC (operational), Clubs & Societies (activities) and Intelligence (supporting; it should not manufacture competency judgements from attendance, access logs or raw counts).

12.2 Improvements to our own system (SEP)

Priority	Improvement	Why it matters
1	Define clear, observable competencies	Avoids vague judgements such as "good leader"
2	Separate competence from evidence sufficiency	A student may have ability but insufficient documented evidence
3	Record activity opportunities and context	Students have unequal access to clubs, roles and events
4	Link every assessment claim to evidence	Prevents unsupported claims and generic personality judgements
5	Introduce structured rubrics and calibration	Assessors may otherwise score the same behaviour differently
6	Build correction, moderation and appeal processes	Students need a way to challenge unfair assessments
7	Make the student profile useful, not reductive	A single score can hide context, growth and uncertainty
8	Enforce privacy and access controls	Not every campus record belongs in a competency profile

SEP should not treat missing evidence as evidence of poor ability, nor assume that students who attend more events are more competent.

12.3 Recommended architecture to investigate

```
| OUR DEDICATED SEP ASSESSMENT LAYER                              |
| Competencies, evidence, rubrics and evidence sufficiency        |
+-----------------------------+-------------------------------+
                              |
                              v
+-------------------------------------------------------------+
| CHC WORKFLOW CAPABILITIES, IF SUITABLE                      |
| Review, verification, moderation, correction and appeals    |
+-----------------------------+-------------------------------+
                              |
                              v
+-------------------------------------------------------------+
| STUDENT E-PORTFOLIO + APPROPRIATE ANALYTICS                 |
| Evidence-backed development profiles, privacy-conscious     |
| reports                                                     |
+-------------------------------------------------------------+
```

This avoids rebuilding every institutional function and keeps our specialised assessment logic separate from ordinary campus operations. Existing modules should be reused only where their capabilities and integration interfaces satisfy our requirements.

12.4 Next step: a focused gap analysis

I recommend a gap analysis across the five shortlisted modules using one checklist: Can it define and store competencies? Capture individual contributions? Attach and verify evidence? Distinguish performance from evidence sufficiency? Support multiple assessors and moderation? Let students correct records and appeal? Retain development history with appropriate permissions? Integrate with other modules without duplicating student records?

For every item, record one of four findings: **Observed, Documented, Unknown or Confirmed gap.** Start by comparing OBE and Student E-Portfolio in detail, then test CHC as the workflow foundation. Clubs & Societies provides activity context; Intelligence comes later, once we know what data can be trusted.

13. Proposed Enhancements to Digii Campus

Rather than building an entirely new system, I propose targeted enhancements to existing modules, not a redesign of the platform. We preserve useful capabilities (student records, clubs, workflows, portfolios, analytics) and add missing assessment logic only where investigation shows it is needed. These are proposed enhancements, not confirmed defects in Digii.

Priority	Module	Proposed changes	Why
1 (highest)	**Student E-Portfolio:** add a Student Development Profile	Structured competency profile (collaboration, communication, problem-solving, coordination and responsibility, ethical decision-making, self-directed learning and reflection); each claim linked to evidence, source, context and verification status; feedback, development over time and evidence limitations; student correction requests	The most natural place for students to see their own development
2	**OBE:** add a Non-Academic Competency Assessment pathway	Non-academic competencies defined separately from academic outcomes; behaviourally anchored rubrics; performance level recorded separately from evidence sufficiency; multiple assessors, calibration and moderation; kept separate from academic grades unless validated	OBE's focus on outcomes makes it a logical module to investigate; its academic model should not be assumed to transfer unchanged
3	**Clubs & Societies:** record contributions, not just participation	Organisers record roles and responsibilities; capture outputs (event plan, deliverable, documented contribution); evidence submitted by students and verified by organisers; distinguish membership, attendance, roles and demonstrated competencies	Attending and coordinating an event are different experiences; neither earns a competency score without evidence

Priority	Module	Proposed changes	Why
4	**CHC / Dynamic Workflows:** create an assessment review workflow	Submission, reviewer assignment, evidence verification and decision stages; moderation of uncertain or disputed assessments; correction requests and appeals with independent review; retained decision history, comments and timestamps; clear status updates to students	CHC documents configurable requests, assignments and escalation; test this before proposing a separate workflow engine
5	**Intelligence / Analytics:** add responsible development reporting	Assessment completion, evidence coverage and trends; which competencies have sufficient evidence; reviewer agreement and group differences where appropriate and lawful; clear metric definitions; no default leaderboards or single composite scores	Reports should improve opportunities and assessment quality, not turn incomplete records into misleading judgements

13.1 The improved end-to-end experience

```
STEP 1  Activity is created
        A club creates an event and records roles and responsibilities.
            |
            v
STEP 2  Student submits evidence
        The student records their contribution and attaches outputs.
            |
            v
STEP 3  Evidence is reviewed
        An authorised assessor evaluates it against a defined rubric.
            |
            v
STEP 4  Assessment is checked
        Uncertain or disputed decisions can be moderated, corrected
        or appealed.
```

```
            |
            v
STEP 5  Profile is updated
        The portfolio shows the supported claim, evidence, feedback
        and limitations.
```

This is a proposed workflow. It requires verified integration between modules, or an additional assessment layer if existing products cannot support it.

13.2 Phasing

Phase	Work	Intended result
1. Validate and configure	Test OBE, E-Portfolio and CHC; inspect forms, permissions, evidence uploads, workflows and integration interfaces	Establish what can be reused without major development
2. Build the assessment layer	Add competency definitions, rubrics, evidence-linked claims, evidence sufficiency, verification and moderation where needed	Implement the core SEP methodology
3. Connect and improve	Link club activities and student profiles; add correction and appeal workflows; create responsible analytics	A connected student-development experience

Before committing to implementation, Digii's product team would need to confirm which extensions, APIs and data-synchronisation mechanisms are supported.

13.3 Keeping recommendations defensible

I would not write that a Digii module is deficient simply because a feature was not found on the website. For each enhancement we document the existing capability, the unverified requirement, the proposed enhancement, the expected benefit and an acceptance test. Example (evidence verification): *existing capability:* CHC documents request routing and approval workflows; *unverified requirement:* whether its forms can link uploaded evidence to a competency claim; *proposed enhancement:* an evidence-review stage with an authorised reviewer and explicit verification status; *expected benefit:* more traceable and consistent assessments; *acceptance test:* submit a claim, attach evidence, assign a reviewer, record a decision and confirm the student can see the outcome and its history.

14. Final Recommendation

Do not propose replacing Digii Campus; propose extending it with a dedicated non-academic student-development capability. Use **E-Portfolio** as the candidate student-facing profile, investigate **OBE** for competency assessment, test **CHC** for review workflows, use **Clubs & Societies** as an activity source and investigate **Intelligence** for reporting. Keep the assessment methodology governed by SEP, with explicit evidence, fairness and privacy safeguards. This leaves room for the actual demo and technical validation to determine exactly which changes Digii needs.
