Non-Academic Student Development: Summary Report and Digii Campus Enhancement Proposal

Executive Summary

Universities measure academic performance rigorously (grades, CGPA) but have no reliable way to measure non-academic development: clubs, events, volunteering, leadership, competitions and group work. BML Munjal University, for example, counts it for marks only in years 1 and 2 through the Enrichment Credit Course, and those grades do not help students develop.

This report proposes a **fair, evidence-based way to assess non-academic development**, and a plan to **extend Digii Campus** (not replace it) to support it. The core idea is a closed loop: **collect verified evidence, assess with rubrics, identify each student's development needs, assign targeted programmes, and reassess to measure improvement.**

Recommendation: extend Digii with a dedicated non-academic development capability, reusing E-Portfolio, OBE, CHC workflows, Clubs & Societies and Intelligence where they fit, and run a focused gap analysis before building anything.

Critical Observations

1. **Participation is not performance.** Attending ten events does not mean better teamwork than attending three. Attendance, contribution and growth must be recorded separately.
2. **Missing evidence must never become a zero.** If a student has no valid evidence for a dimension, it is marked "not assessed", and coverage gaps are flagged.
3. **Titles and hours prove little.** A club position, a membership record or logged volunteering hours do not by themselves earn a leadership or contribution score.
4. **Group students by needs, not by total score.** Two students scoring 65/100 can need completely different support.
5. **Weights and cut-offs are illustrative.** The 20/15/15/15/15/20 weights and any band thresholds must be validated by a college before use.
6. **Improvement is not proof of causation.** A 45 to 70 score rise needs a comparison group to show the programme caused it.
7. **Digii's fit is unverified.** Fit with Digii's modules is based on public product descriptions. Nothing here claims Digii is deficient; each enhancement needs testing first.
8. **Fairness is a design requirement.** Students must see their evidence, correct records and appeal. Scores describe skills, not people's potential.
9. **Avoid proxy metrics.** Hostel usage, mess spending or campus-facility visits do not establish non-academic performance.

1. The Problem

Academic work is assessed by quizzes, exams, presentations and projects that feed into a grade. Non-academic work (ACM-style workshops and hackathons, volunteering, governance, competitions) happens in groups where each member's role differs: organiser, marketer, backend support, participant. Without a way to capture who did what and how well, students cannot see where to improve and professors cannot give targeted guidance.

2. Proposed Framework: Six Observable Dimensions

Vague traits such as "good character" cannot be measured directly, so we break them into observable dimensions. This is a proposed framework, not a universal formula.

#	Dimension	Key question
1	Collaboration and teamwork	Does the student communicate and share responsibility?
2	Leadership and initiative	Does the student coordinate people and take initiative?
3	Contribution and community	Does the student contribute to clubs, service and projects?
4	Responsibility and reliability	Does the student meet agreed deadlines and tasks?
5	Creativity and problem-solving	Can the student produce useful solutions?

#	Dimension	Key question
6	Personal and professional development	Is the student growing through training and feedback?

Every record should capture the activity, the student's actual role, the evidence, who verified it, the criteria and the date.

3. How Scoring Works

Rubric-based assessment (example: teamwork). An evaluator rates four criteria (communication, sharing responsibilities, supporting teammates, handling disagreement) from 1 to 4. Scores of 3, 4, 3, 3 give 13 / 16 x 100 = **81.25 / 100**. Levels: 1 Needs improvement, 2 Developing, 3 Proficient, 4 Strong.

Indicators from records.

- Participation rate = eligible activities attended / offered. Example: 8 of 10 = 80%.
- Reliability rate = tasks completed on time / tasks due. Example: 10 of 12 = 83.33%. A student with no tasks is not scored zero.
- Skill development = later score minus baseline. Example: 60 to 75 = +15.

Composite score (illustrative). S = sum of (weight x dimension score).

Dimension	Score	Weight	Points
Teamwork	80	20%	16.00
Leadership	75	15%	11.25
Community contribution	70	15%	10.50
Reliability	90	15%	13.50
Problem-solving	85	15%	12.75
Development	80	20%	16.00
Overall		100%	**80.00 / 100**

Individual dimension scores must always be shown beside the total, since two students at 80 can have very different strengths.

4. Proposed Product Modules

These are a proposed design, not a claim about existing Digii capabilities.

#	Module	Purpose
1	Clubs and Societies Management	Memberships, positions, responsibilities, verified contribution
2	Events and Participation	Registrations, QR attendance, roles, post-event

#	Module	Purpose
		contribution
3	Volunteering and Community Service	Approved hours, supervisor verification, outcomes
4	Leadership and Student Governance	Council and committee roles, assessed performance in the role
5	Projects, Competitions and Innovation	Hackathons, case competitions, portfolios
6	Skills and Development	Workshops, certifications, baseline and follow-up assessments
7	**Assessment and Verification Engine** (core differentiator)	Rubrics, evaluators, evidence verification, dimension scores
8	Student Development Profile and Analytics	Student profile and aggregate college reports

Additional ideas: peer and mentor feedback, a verified achievements portfolio, and a task tracker for club officers.

5. From Scores to Action: Segmentation and Intervention

Scores alone only rank students. The proposed **Student Development Segmentation and Intervention System** answers: "We have the scores; what do we do next?"

Layer A: skill-based development groups (temporary pathways, not permanent labels):

Group	Support
Strong skills, communication gap	Speaking and presentation workshops, mock interviews
Individual contributor, teamwork gap	Rotating-role team projects, peer feedback
Strong contributor, leadership development	Lead a small project or event with supervisor feedback
Potential evident, reliability needs support	Milestone planning and mentor check-ins (first investigate barriers such as workload)
Strong ideas, needs practical execution	Prototype and innovation lab
Ready for advanced opportunities	Cross-functional projects, peer mentoring

Layer B: broad readiness bands (Foundation, Developing, Progressing, Advanced) are optional, not shown publicly, and have no fixed cut-offs until validated.

How a student is matched. Example profile: problem-solving 90, reliability 85, teamwork 80, leadership 72, communication 45. The system suggests a communication pathway, then a person reviews: validate

the evidence, check the student's goals, confirm the plan with the student, and reassess afterwards. Recommendations start rule-based; no machine learning is needed.

Mentorship and programme management. A dedicated module registers mentors, expertise, capacity and schedules, matches students to programmes, and tracks attendance, completion and outcomes. Mentors are matched on expertise and suitability, and may be coaches, alumni or industry professionals.

Measuring whether programmes work. Track baseline, attendance, follow-up scores and feedback. In the worked simulation, communication rises from 45 to 72 (+27) after a programme, but the student is not auto-promoted: leadership (63) becomes the next pathway. A student can be in several pathways at once and shifts to maintaining a skill once the target is met.

Student Growth Intelligence is the working name for the full layer: segmentation engine, programme management, mentor matching, outcome measurement, and fairness and oversight. Its advantage is one connected workflow: evidence, diagnosis, targeted intervention, measured improvement.

6. Comparison with Digii Campus Modules

The proposed approach, **Situated Evidence Profiling (SEP)**, focuses on evidence-backed competency claims, evidence sufficiency, fair assessment, moderation, student correction and appeals. Fit is based on public product descriptions; anything not established is marked unverified.

Digii module	Role in our architecture	Main unverified points
Student E-Portfolio	Student-facing, evidence-backed profile	Competency-linked claims, rubrics, moderation, appeals
OBE	Competency definitions and assessment model (closest overlap)	Non-academic use, evidence verification
Clubs & Societies	Source of activities and contribution records	Individual contribution verification
CHC / Workflows	Review, escalation and appeals engine	Evidence upload, independent moderation
Intelligence	Reporting layer, only after data quality is assured	Cannot validate source evidence

Conclusion: none of the public descriptions establishes the full SEP process. SEP is more directly aligned with fair non-academic assessment, while Digii has broader mature infrastructure to build on.

Eight design improvements for SEP: (1) define observable competencies, (2) separate competence from evidence sufficiency, (3) record opportunity and context, (4) link every claim to evidence, (5) use calibrated rubrics, (6) build correction, moderation and appeals, (7) keep profiles useful rather than reductive, (8) enforce privacy and access controls.

7. Proposed Enhancements to Digii Campus

Targeted extensions, not a platform redesign. These are proposals, not confirmed defects.

Priority	Module	Proposed change
1	E-Portfolio	Add a Student Development Profile: evidence-linked claims, verification status, growth, correction requests
2	OBE	Non-academic competency pathway: behaviourally anchored rubrics, performance separate from evidence sufficiency, multiple assessors, moderation
3	Clubs & Societies	Record contributions, not just participation: roles, outputs, organiser-verified evidence
4	CHC Workflows	Assessment review workflow: reviewer assignment, moderation, appeals, decision history
5	Intelligence	Responsible reporting: evidence coverage, reviewer agreement, no default leaderboards or single composite scores

Phasing.

1. **Validate and configure:** test OBE, E-Portfolio and CHC; inspect forms, permissions, evidence uploads and integration interfaces.
2. **Build the assessment layer:** competencies, rubrics, evidence-linked claims, evidence sufficiency, verification and moderation where needed.
3. **Connect and improve:** link club activities to profiles, add correction and appeals, launch responsible analytics.

Each enhancement should be documented with the existing capability, the unverified requirement, the proposed change, the expected benefit and an acceptance test. Digii's product team must first confirm supported extensions, APIs and data synchronisation.

8. Recommendation and Next Steps

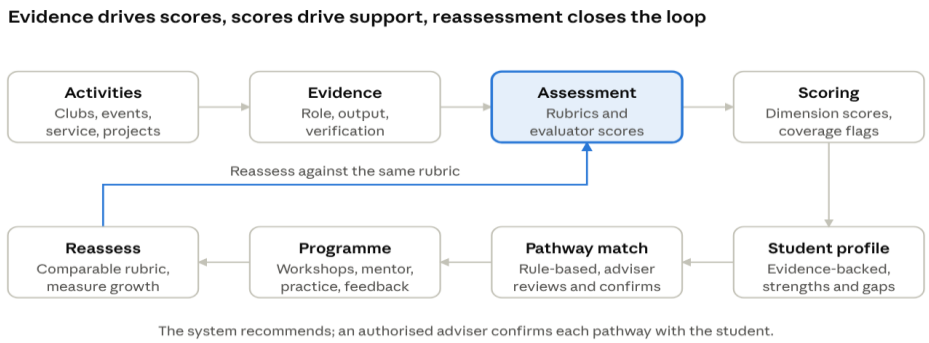

Do not replace Digii Campus. Extend it with a non-academic student-development capability governed by SEP, with explicit evidence, fairness and privacy safeguards.

Next steps:

1. Run a focused gap analysis across the five shortlisted modules (OBE and E-Portfolio first, then CHC), recording each checklist item as Observed, Documented, Unknown or Confirmed gap.
2. Confirm integration options with the product team.
3. Use the demo and technical validation to decide the exact changes needed.

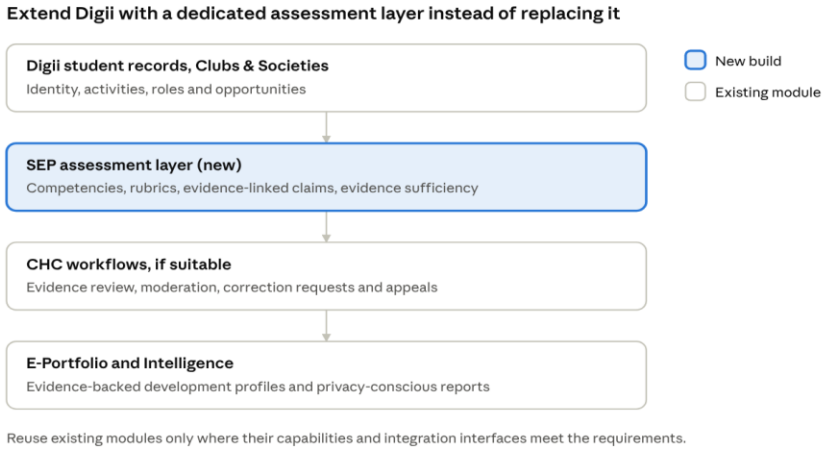

Final safeguard: the platform should describe assessed skills and development needs, never label a student as inherently weak or superior.

Figure 1: The assess-support-reassess loop

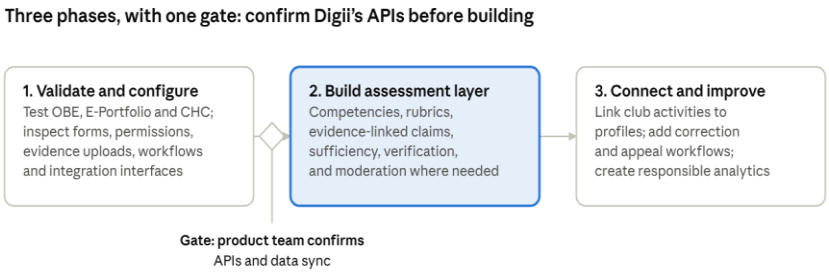

Activities generate evidence, rubric-based assessment turns it into scores, and the student is matched to a programme. Reassessment feeds back into assessment.

Figure 2: Proposed architecture on top of Digii

Only the SEP assessment layer is new; records, workflows, portfolio and analytics are existing Digii modules, used where they fit.

Figure 3: Phased rollout

Validation comes first. The product team's confirmation of supported extensions, APIs and data sync decides how much must be built.
