Internship Worklog — Week 2 - Dhruv Jain
Reporting Period: 19 October – 23 October 2026

Monday, 19 October 2026 — Continued BI Product Familiarisation

- Continued exploring the Digii Campus BI portal, revisiting the modules examined during the initial familiarisation phase.
- Practised navigating the CHC, Access Management, Placements, Feed, Infrastructure, Booths, Mess, Assets, and Hostels modules to improve familiarity with the interface and available workflows.
- Focused on understanding the purpose of individual sections, the options exposed by the interface, and the expected behaviour when interacting with them.
- Continued organising product observations and identifying areas where further functional clarification would be useful.

Outcome: Reinforced familiarity with the BI portal and established a more structured basis for examining module workflows.

Tuesday, 20 October 2026 — Repeated Workflow Practice and Research Scoping

- Repeatedly practised navigating the selected BI modules to strengthen understanding of their structure and user-facing workflows.
- Re-examined available options and noted areas where an action did not produce an obvious result, distinguishing observed behaviour from assumptions about the cause.
- Defined the initial direction of a student-development research assignment, focusing on how non-academic student progress could be represented and supported through institutional systems.
- Continued independent preparation for AI Product Engineering, including Python learning and identifying relevant foundational topics.

Outcome: Improved familiarity with the selected product modules and established an initial scope for the student-development research task.

Wednesday, 21 October 2026 — Initiation of Student-Development Research

- Started substantive research into a framework for documenting and understanding students' non-academic development and growth.
- Reviewed existing product-research material relating to student records, bulk data imports, events, clubs, certificates, outcome-based education, and related campus workflows.
- Began considering how existing institutional data and administrative processes could support a structured student-development framework.
- Organised the initial research direction around the relationship between student information, development evidence, and the capabilities of an institutional platform.

Outcome: Established the initial research foundation and identified existing campus-system capabilities relevant to the proposed student-development framework.

Thursday, 22 October 2026 — Research Structuring and Documentation

- Developed and organised research documentation for the proposed Student Evolution/Development framework and related Student Growth Intelligence concepts.

- Structured comparisons between the proposed framework and existing Digii Campus modules to identify areas of alignment, potential reuse, and functionality requiring further consideration.
- Considered architectural and operational aspects including student records, evidence collection, verification, moderation, correction or appeal processes, and reporting.
- Worked on consolidating the material into a more manageable document so that the findings and proposed direction could be reviewed more clearly.

Outcome: Progressed the research from initial exploration toward a structured document covering product alignment, proposed capabilities, and architectural considerations.

Friday, 23 October 2026 — Research Consolidation and Next Steps

- Continued refining the student-development research and its relationship to Digii Campus's existing product capabilities.
- Further clarified the proposed approach of reusing existing student records, bulk-import functionality, and administrative infrastructure where appropriate, while defining specialised development tracking and evidence-management logic.
- Organised recommendations and outstanding questions concerning verification, moderation, corrections or appeals, reporting, and the boundaries between existing and proposed functionality.
- Identified areas requiring additional validation before treating the proposed framework or its integration approach as final.

Outcome: Consolidated the main research direction and established next steps for validating the proposal and refining the supporting documentation.

Week 2 Summary

During the second week, the focus progressed from repeated familiarisation with the Digii Campus BI portal toward more structured student-development research. The product exploration helped reinforce understanding of the available modules and their workflows, while the research work examined how existing student records and administrative capabilities could support a more systematic approach to non-academic development. Documentation was progressively organised to compare the proposed framework with existing product functionality and identify areas requiring further validation.

Planned continuation: Continue validating the observed BI workflows, clarify unresolved product behaviour with the relevant team where necessary, refine the student-development research, and distinguish confirmed existing capabilities from proposed functionality.
